PGEU GPUE

EMVO MONITORING REPORT — CALENDAR WEEK 12 - 2020

European Medicines Verification
Organisation

AGENDA

STATUS OBP/MAH ON-BOARDING(*)

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis

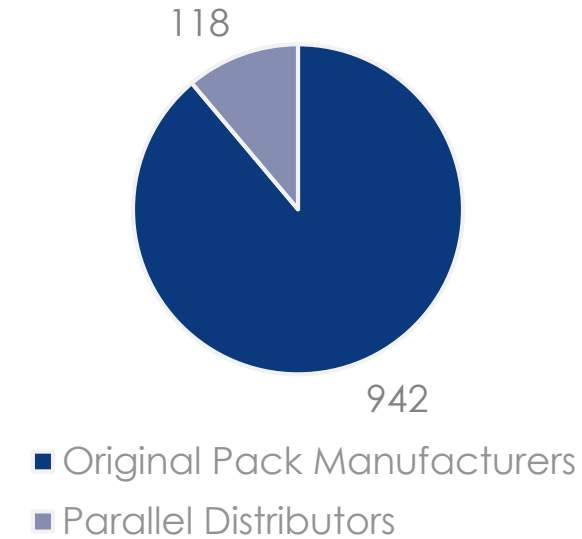

(**) The figure reflecting the number of MAHs listed in the OBP Portal may decrease from one month to the other, as quality check analyses are performed continuously to delete duplicate MAHs listed on the OBP Portal.

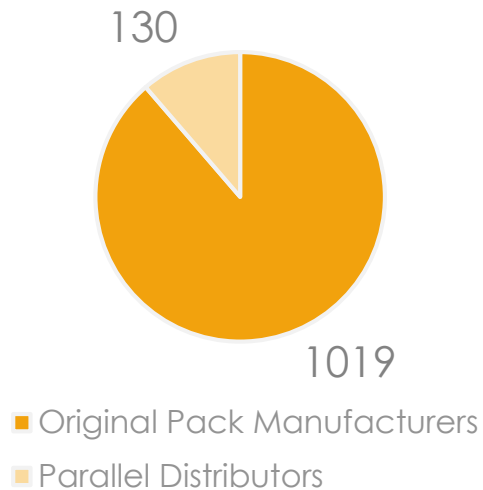

(***) Estimated number of OBPs

OBP_s PER COMPANY TYPE (*)

OBP_s Connected to PRD

Signed Participation Agreements

OBP_s Uploading Data to the EU Hub

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis

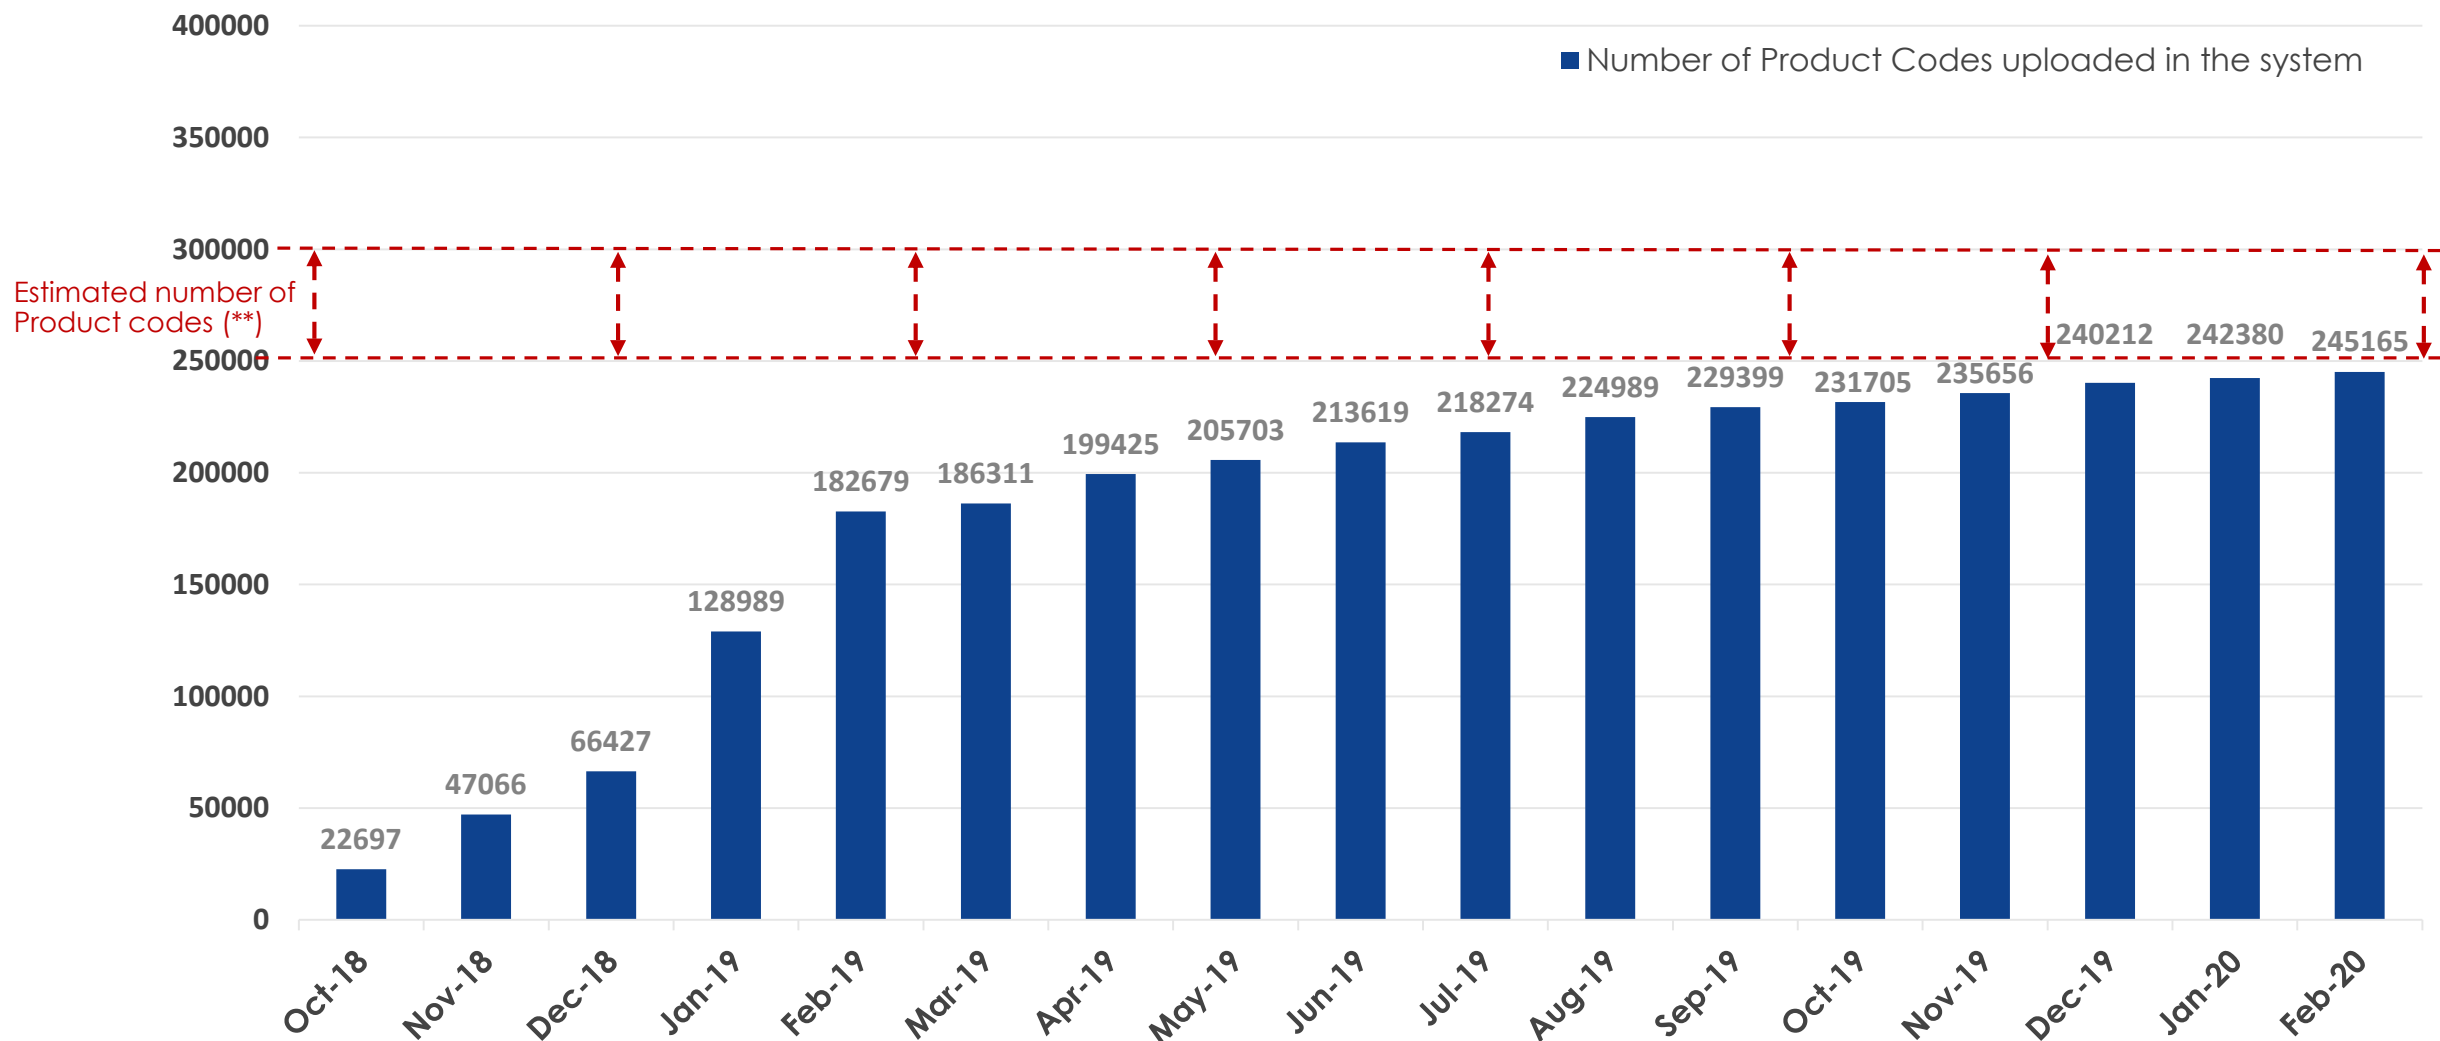

SIGNED PARTICIPATION AGREEMENTS BY OBPs PER COUNTRY(*)

(*) The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis.

This graph shows where the OBP is located, not where the OBP and their affiliates are active in.

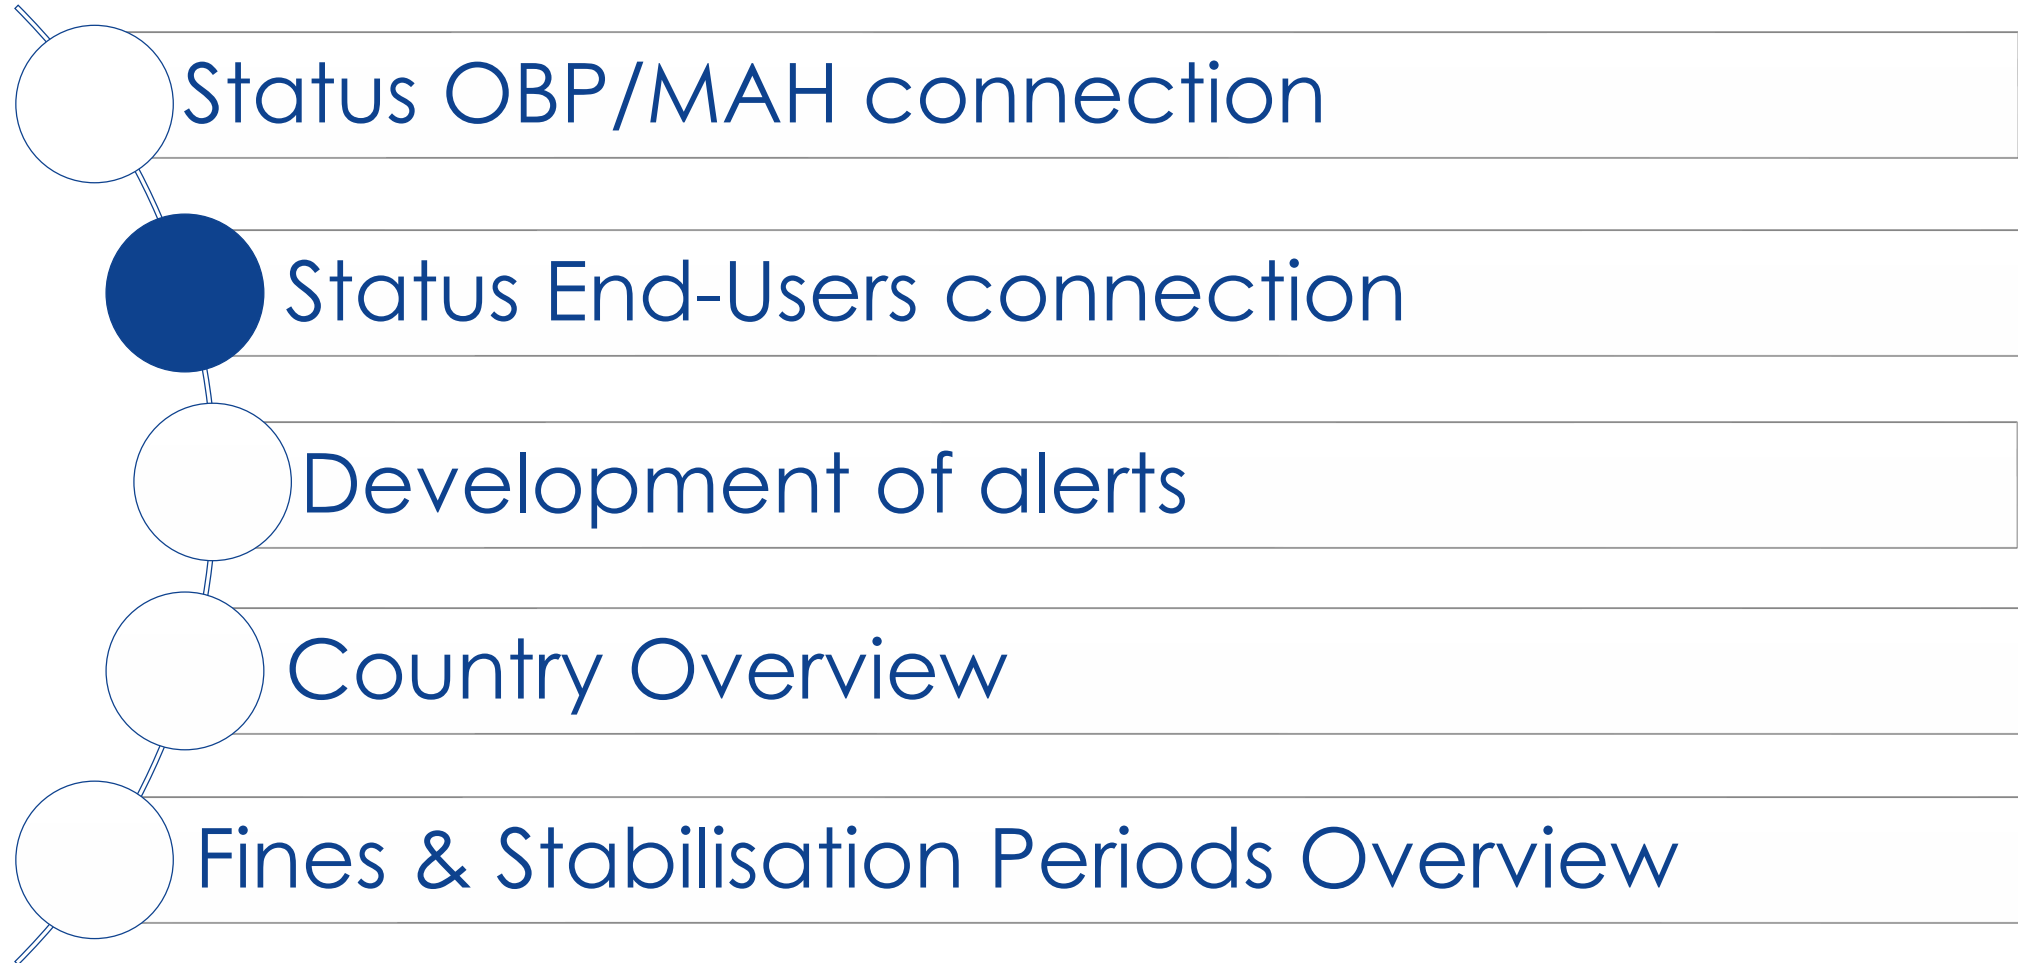

UPLOADED PRODUCT CODES(*)

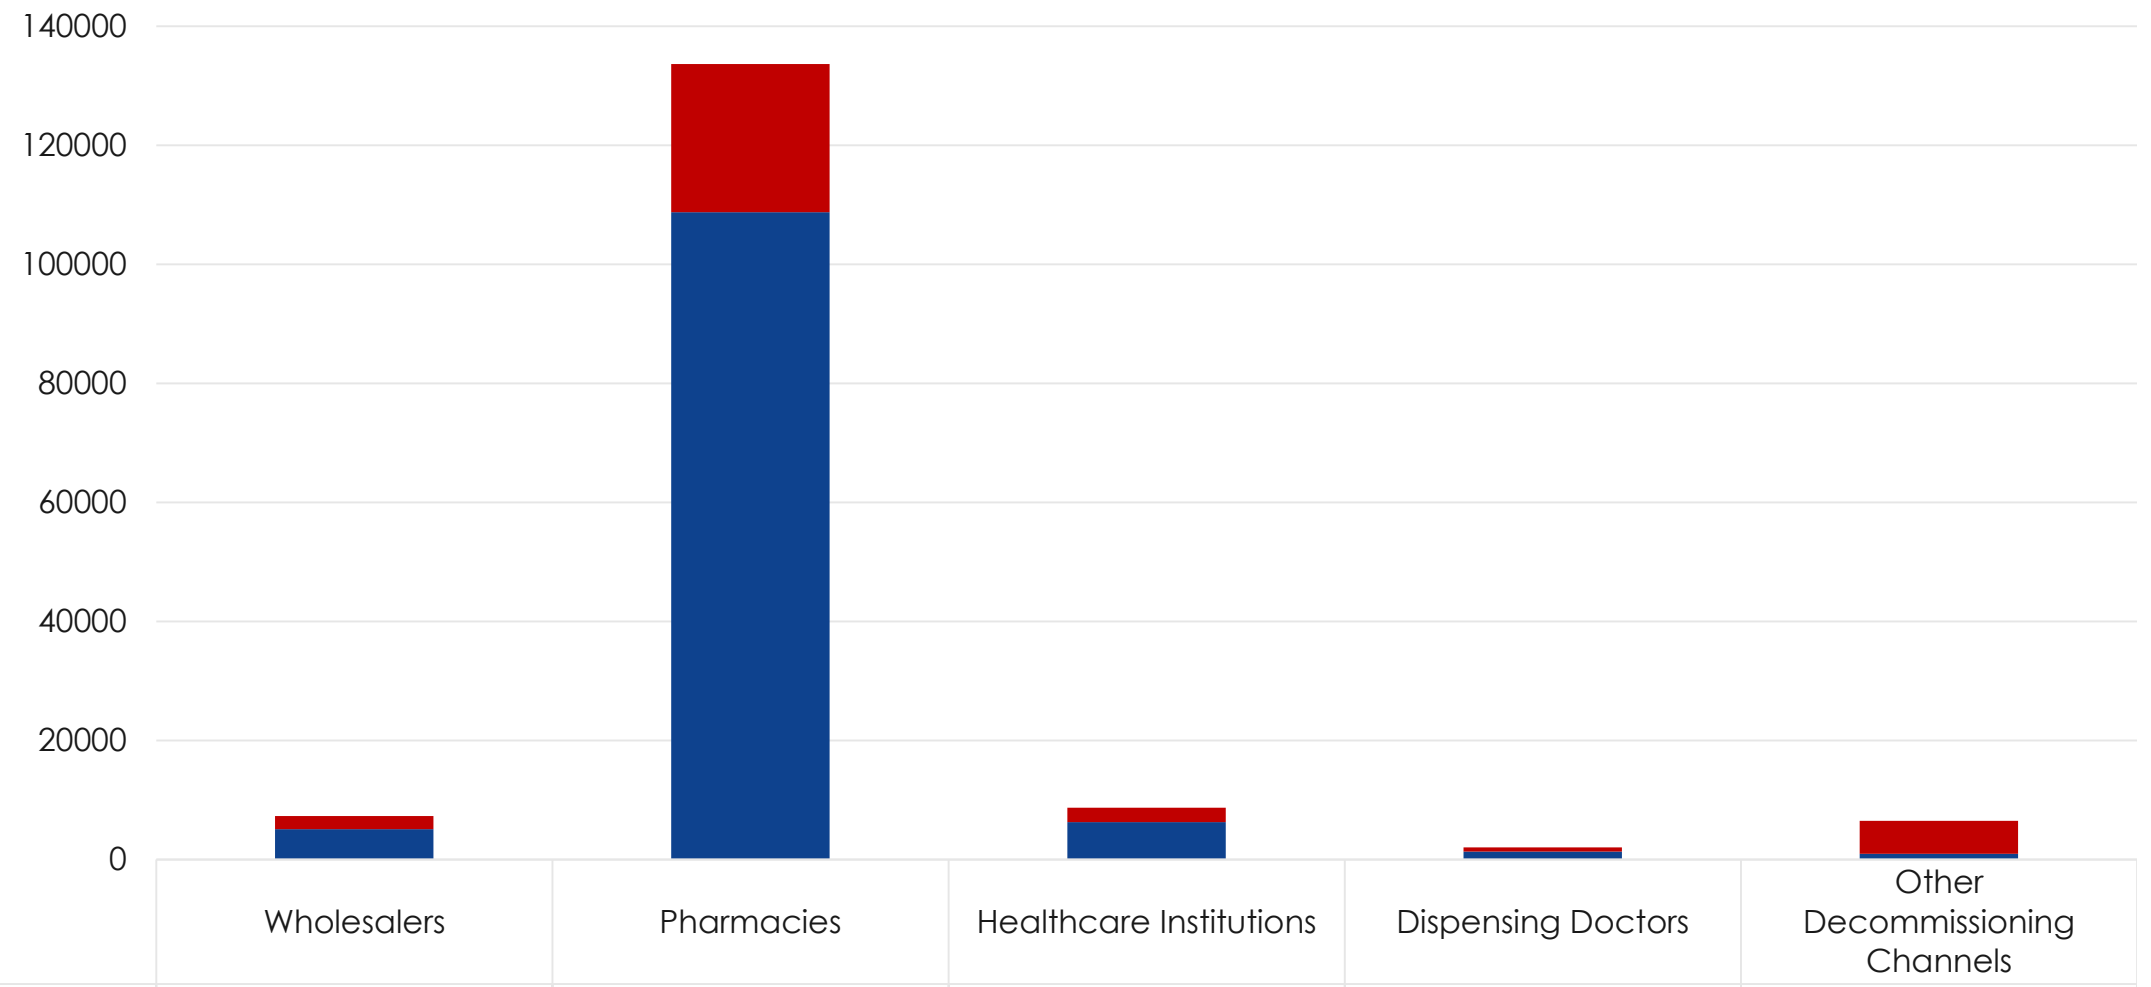

(*) Product code is equal to Stock Keeping Units (SKUs)

(**) Please note that the reported base value is only a rough estimation and is subject to continuous change. EMVO does not warrant that this information is error-free, accurate, complete and up-to-date.

AGENDA

END-USERS CONNECTION OVERVIEW(*)

■ Not connected	2189	24901	2401	728	5539
■ Connected	5111	108791	6324	1338	977
Percentage remaining	29.99%	18.63%	27.52%	35.24%	85.01%

WHOLESALERS CONNECTION BY COUNTRY(*)

Country	AT	BE/LU	BG	CY	CZ	DE	DK	EE	ES	FI	FR	HR	HU	IE	IS		LT	LV	MT	NL	NO	PL	PT	RO	SE	SI	SK	UK
Number of Wholesale distribution authorisations (EudraGMDP)	392	312	230	105	736	1944	206	62	705	95	708	102	150	405	16		113	84	108	410	180	534	411	222	259	85	160	2126

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis

PHARMACIES CONNECTION BY COUNTRY CAP 20.000(*)

HEALTHCARE INSTITUTIONS CONNECTION BY COUNTRY(*)

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis.

(1) As of November, dispensing doctors in Latvia have been added to the healthcare institutions report as legally they all are healthcare institutions.

(2) In The Netherlands (NL) healthcare institutions are connected as pharmacies. Therefore, the On-boarding of healthcare institutions in NL is reflected in the overview on pharmacies connection.

(3) In Norway (NO), hospital pharmacies are connected as pharmacies. The overview on healthcare institutions reflect only the number of hospitals that are connected.

DISPENSING DOCTORS(*)

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis

OTHER DECOMMISSIONING CHANNELS (*)

(*)The information figuring hereunder was collected in Calendar Week 11 2020 and will be updated on a monthly basis.

	DE	FI	FR	HU	IE	SI
Not connected	8	0	60	0	0	0
Connected	94	41	0	8	3	2
Percentage remaining	8%	0%	100%	0%	0%	0%

	UK (**)
Not connected	5471
Connected	829
Percentage remaining	86.84%

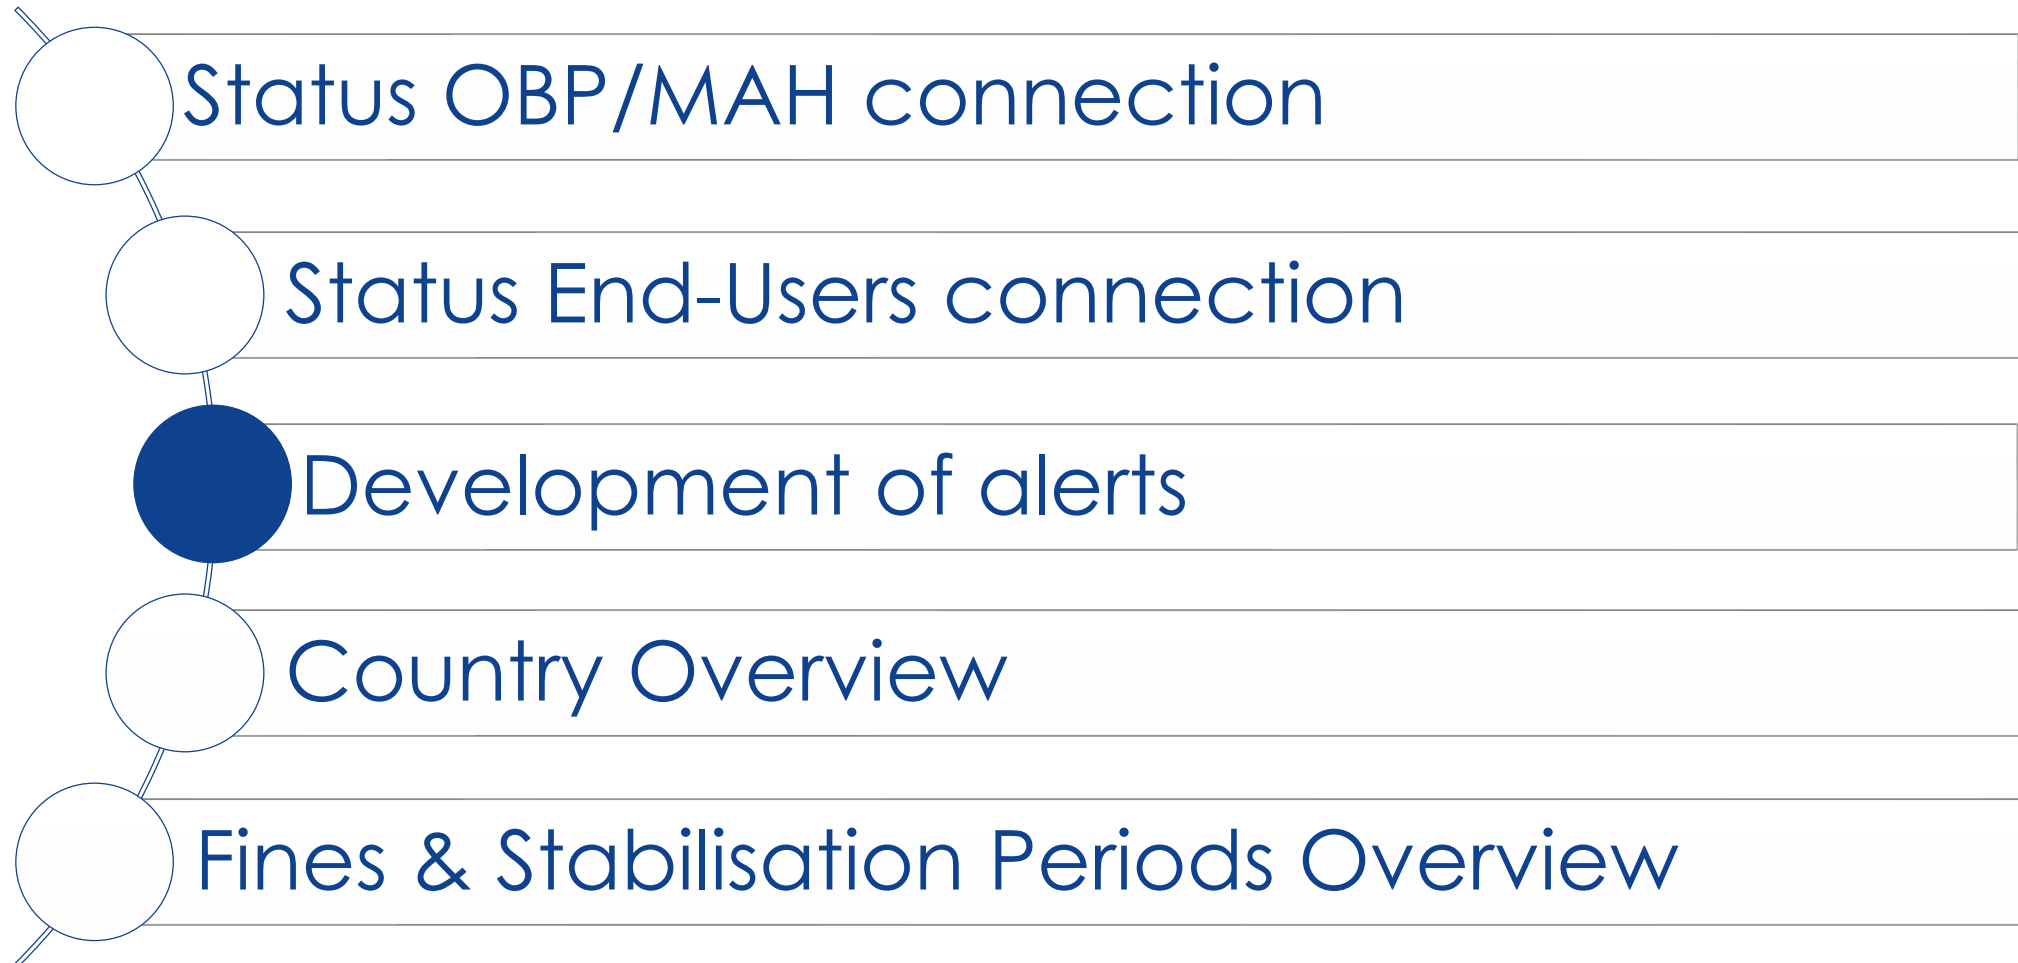

(**) For the United Kingdom (UK) the figures on dispensing doctors and other decommissioning channels are all reflected in the present slide as dispensing doctors are part of the same GP/Health Centers community as the other decommissioning channels.

OTHER DECOMMISSIONING CHANNELS

Depending on the country, other decommissioning channels may include :

- Industrial Blister Centers
- Compounder
- Central Purchasing Agencies
- Health Centers
- Private renal dialysis clinics

AGENDA

IMPORTANT NOTE

- EMVO © 2019. All rights reserved.
- This version of the EMVO monitoring report represents EMVO's effort to provide the audience with the latest information regarding the development of alerts and to keep, to the best of its knowledge, the information complete, accurate and up-to-date. **EMVO is using its best efforts to collect and compile the necessary data for the above purposes and will continue to constantly working on improving the quality of the information contained herein.**
- Please note that the information included therein may be subject to continuous changes and that nothing therein constitutes any representation, guarantee or warranty of any kind, whether expressed or implied or against the occurrence or prevention of alerts on the part of EMVO. EMVO shall not be responsible for any direct or indirect damage, loss or claims of any kind in connection with or arising out of the use of any information disclosed hereunder.
- This report will be further developed in the upcoming weeks and EMVO and the NMVOs will work together with all involved parties on preventive actions.
- This report displays alert data related to all countries forming the EMVS.
- Glossary:
 - Absolute = Total number of Alerts
 - Rate = Total number of alerts in relation to the total number of scans by End-Users or in relation to the market size (divided by 52 to be reflected per week).

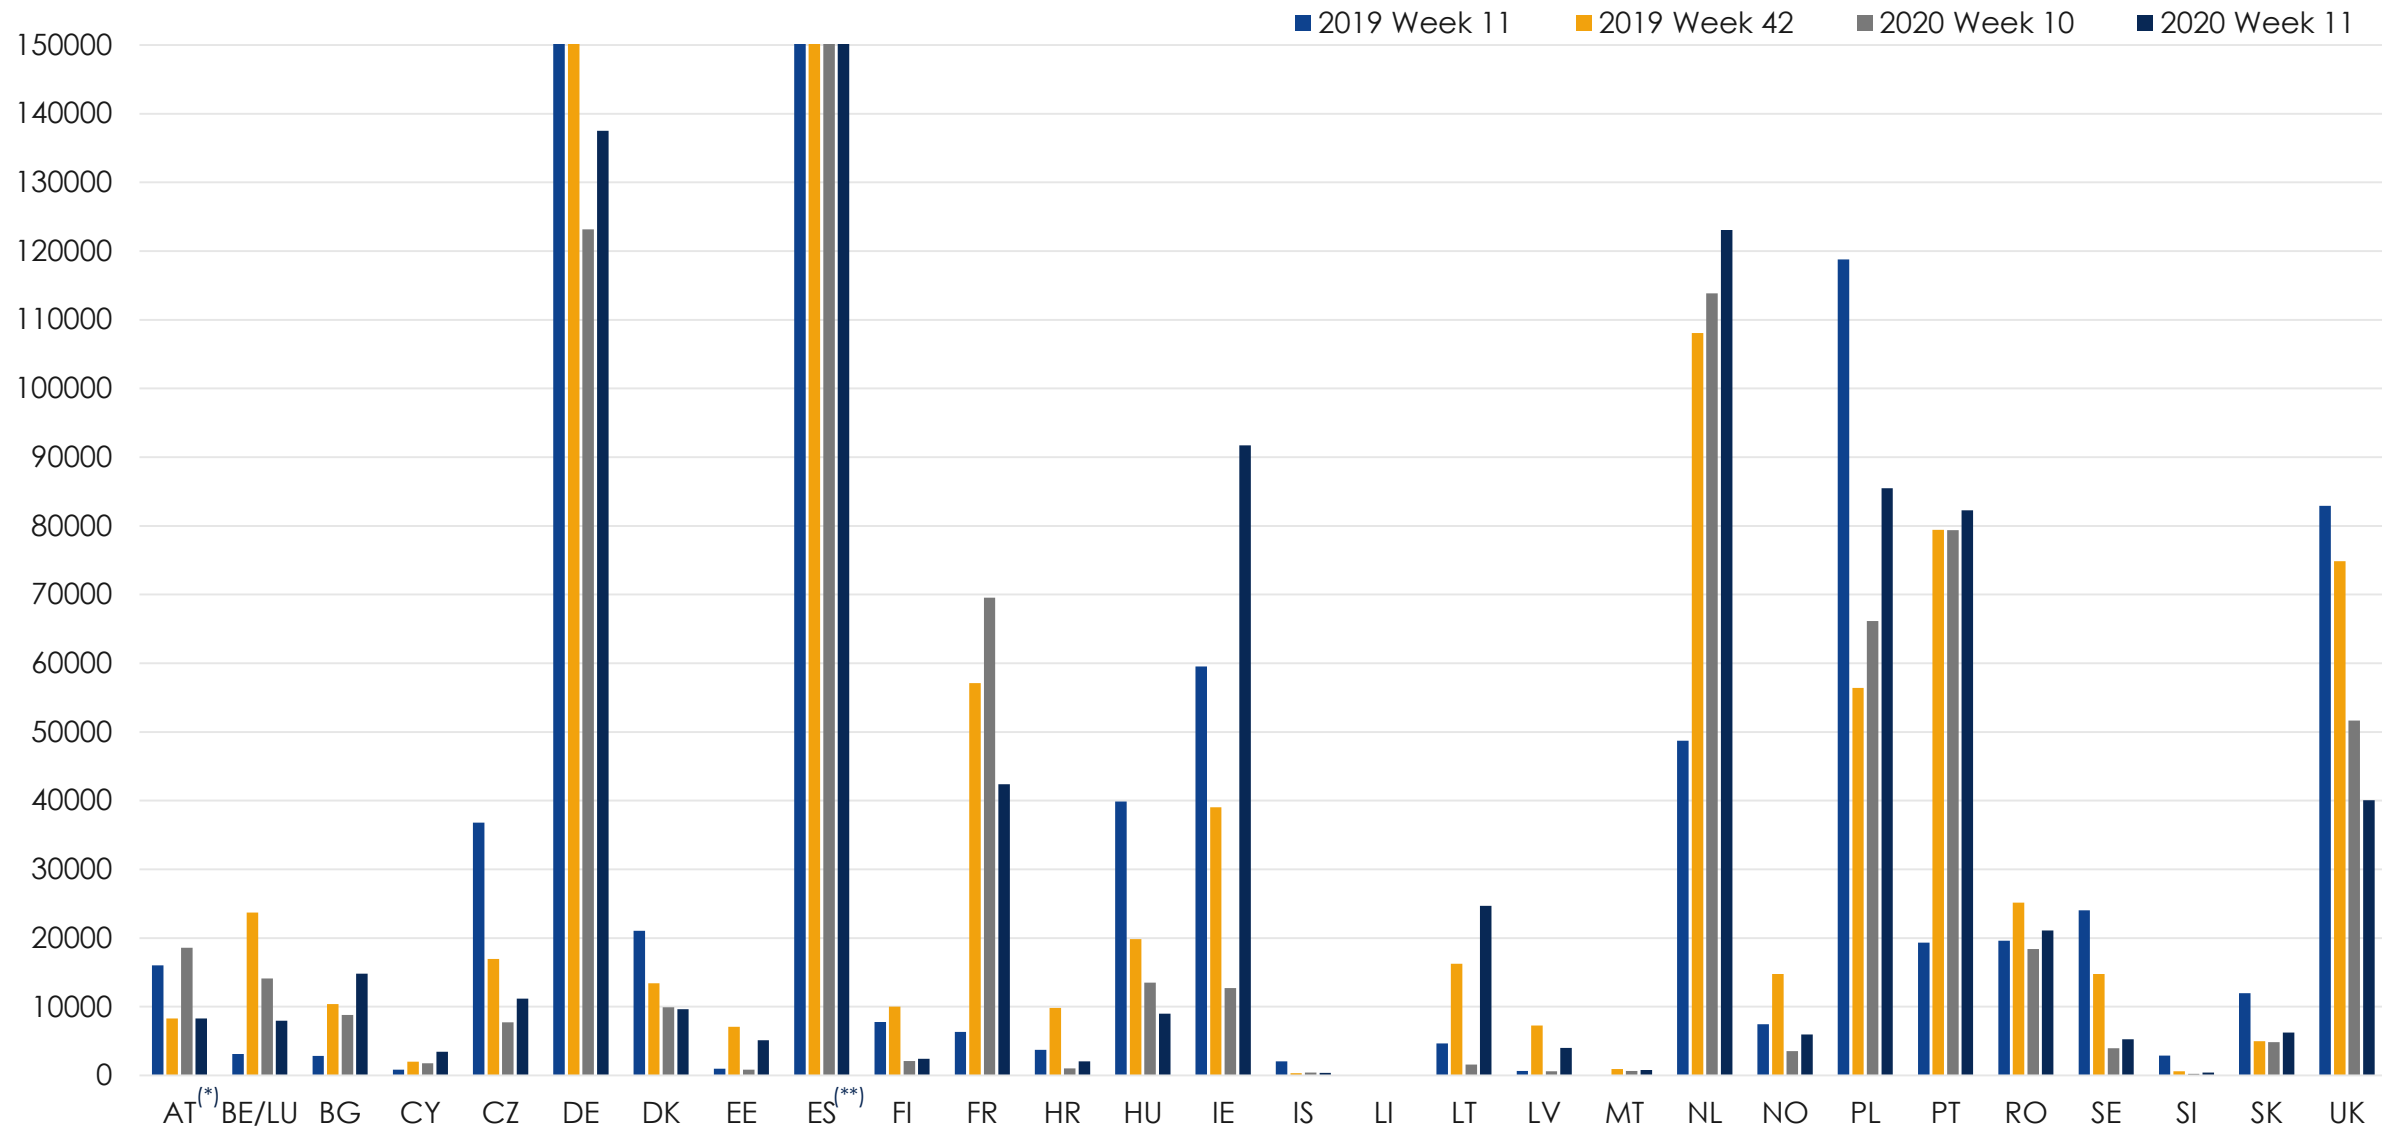

OVERVIEW OF ALERTS AND SCANS IN ALL COUNTRIES

TOTAL NUMBER OF ALERTS IN RELATION TO THE TOTAL NUMBER OF SCANS IN ALL COUNTRIES

ABSOLUTE : ALL CATEGORIES OF ALERTS PER COUNTRY - CAP 150 000

RATE : TOTAL NUMBER OF ALERTS IN RELATION TO THE TOTAL NUMBER OF SCANS – PER COUNTRY (*) – CAP 8%

RATE : TOTAL NUMBER OF ALERTS IN RELATION TO THE TOTAL NUMBER OF SCANS – PER COUNTRY(*) – IN DECLINING ORDER

2020 Week 10

2020 Week 11

PREVENTATIVE ACTIONS - EMVO

- End-User scanner misconfiguration and End-User software are a root cause of a huge number of alerts. To address these, EMVO has reached out to provide guidance to End-User software providers. This is being spread via the Blueprint provider and the NMVOs;
- EMVO intends to facilitate the communication between OBPs and NMVOs and accelerate the identification of alert patterns. In that respect, EMVO has:
 - shared OBP SPOC and SPOC Assistant details with NMVOs
 - reached out to all OBPs with a Letter of Announcement which includes all alert specific NMVO email addresses.
 - will regularly share OBPs' Org. ID in the system to allow for enhanced investigations on the root cause of an alert
- EMVO has hosted workshops in Brussels which have allowed the sharing of experiences/learnings with NMVOs & OBPs and this will continue on an ongoing basis;
- EMVO is continuously assessing the means of improving the system design so to ease the process and the investigation of alerts, notably in terms of IMTs. EMVO also maintains close collaboration with the NMVOs in order to improve the system interoperability.
- EMVO will share further guidance to OBPs to mitigate #A7 and #A24 Alerts – *attempt to decommission an already decommissioned pack*;
- EMVO will be reaching out to OBPs on a regular basis via Letters of Announcement to provide further guidance and updates on the development of alerts in the EMVS;
- EMVO will reflect with the NMVOs regarding provision of test data (codes) to End-Users for the purpose of validating that each of their terminals passes the test set by these codes – this has been already successfully achieved in Slovenia.

PREVENTATIVE ACTIONS - NMVOs

- NMVOs have created dedicated task forces, which include stakeholder representatives to analyse alert data and identify ways to diminish the number of false alerts at national level;
- The NMVOs, where applicable, are continuously educating End-Users to only scan products which fall within the FMD scope. They are also in close contact with the manufacturers to remedy the missing or incorrect data upload, and with the IT providers to address the scanners incorrect configuration;
- The NMVOs are evaluating their systems and End-User behaviour patterns;
- The NMVOs are implementing ad hoc solutions designed to test and validate the End-Users' scanner configuration (caps lock, GS1 Data terminator reading, inverse barcodes, special characters, etc.);
- The NMVOs are working jointly with the end-user software providers, including circulating EMVO guidance;
- The NMVOs are organizing meetings and webinars to receive general feedback on alert profile & root causes to MAHs;
- The NMVOs are in contact with industry associations to flag the problems and the need for action;
- The NMVOs are requesting analyses of alerts per product/batch, as well as monthly report on alerts per MAH to be sent to the NCAs;
- The NMVOs are in continuous communication and alignment with the relevant NCAs;
- The NMVOs maintain a close collaboration with EMVO in order to improve the system interoperability (timestamps, for example).

These preventative actions will be regularly updated in future reports, per alert category, also identifying the responsible party and respective timeline.

DEVELOPMENT OF ALERTS

#A2

Batch ID unknown

#A24 & #A7

Attempt to decommission an already decommissioned pack

#A3

Unknown serial number

#A52

Expiry date mismatch

#A68

Batch ID mismatch

STRUCTURE OF THE SLIDES ON ALERT DATA

- In order to reflect the data on alerts, the following structure applies to each of the alert categories :
 - The rate of this alert: total number of alerts in relation to the total number of scans by End-Users
 - The absolute values : total number of alerts
 - The root causes which have been identified
 - The preventive actions which are being undertaken
- Every new input related to the root causes and preventive actions will be indicated in **bold**
- The list of root causes per alert is non-exhaustive
- In order to circulate a meaningful and readable report – showing the trend in the alerts generated and the follow-up accordingly – the data is not being reflected for all weeks. However, the data is being collected for all weeks starting from week 11 2019.

e.g. for the present report we have reflected the data for weeks 11 & 42 in 2019 and 10 & 11 in 2020.

NB: Alert rates for Malta are strictly number of alerts caused by scans by local End-Users, expressed as a percentage of total number of local scans.

#A2 - BATCH ID UNKNOWN ➤

ROOT CAUSES

CAUSED BY OBPs:

- (Correct) batch not uploaded (legacy packs, pack distributed under Art. 126a of Directive 2001/83/EC)
- One element of the Data Matrix Code appears in the batch field, because group separators have not been set properly
- An OBP with 'Indian packs' uses a GTIN which they will later use for serialised packs causes this alert when master data is uploaded using the same GTIN
- Retrospective upload capability not implemented in the OBP software
- Transactions misuse for training/test purposes in PRD

➤ CAUSED BY END-USERS:

- End-Users scan products which are not in scope of FMD
- End-User software sends the wrong Batch ID, with a mismatch to the data which is encoded in the Data Matrix Code
- The decoding software of the End-User was unable to correctly interpret the group separator characters and/or the scanner was incorrectly configured
- Incorrect reading of uppercase/lowercase characters due to End-User software/scanner misconfiguration
- Manual entry error by the End-User
- Failed scanning procedure : batch number incomplete (missing characters) or linear barcode (EAN code) attached to batch number
- Scanner misconfiguration : concatenation of two codes in one during a fast scanning sequence
- Transactions misuse for training/test purposes in PRD

#A2 - BATCH ID UNKNOWN

PREVENTIVE ACTIONS

UNDERTAKEN BY NMVOs:

❖ Towards OBPs

- Reaching out to OBPs to advise them on the missing data and/or confirm the date of the release of the batch
- Highlighting the necessity for OBPs to retrospectively upload the data for EU-serialized products, released before the 9th February 2019 (referring to COM Q&A 1.12, version 13)
- Collaboration with MAH and IT suppliers

❖ Towards End-Users

- Reaching out to End-Users and End-Users' systems IT suppliers to urge the solving of scanners configuration
- Implementation of ad hoc solutions for End-Users' scanners testing and validation (caps lock, GS1 Data terminator reading, inverse barcodes, special characters, etc.)
- Educating End-Users regarding FMD scope and scanning best practices

➤ UNDERTAKEN BY EMVO:

- EMVO has circulated guidance to the intention of the End-Users, through the IT suppliers and NMVOs, related to scanners configuration and European pack coding guidelines
- Relayed the information about scanners testing and validation solutions implemented by ZAPAZ and private suppliers

#A24 & #A7: ATTEMPT TO DECOMMISSION AN ALREADY DECOMMISSIONED PACK

ROOT CAUSES

➤ CAUSED BY OBPS:

- OBP attempts to decommission an already decommissioned pack (e.g. 'sample to checked out')
- OBP performs batch update on already distributed packs

➤ CAUSED BY END-USERS:

- End-User (software) attempts to decommission an already decommissioned pack (double dispense)
- End-User fails to perform the undo operation
- Both a system dispense and a manual dispense operation are performed for the same pack and same customer
- Pack decommissioned both in central filing and local pharmacies
- End-User performs a destroy operation for a pack already dispensed and inactive in the EMVS
- End-User performs a destroy operation for an expired pack
- Software bugs (creation of a loop)
- Errors leading to the re-sending of request

➤ CAUSED BY THE SYSTEM SETTING:

- Timestamps related issues in IMT in the EU Hub/NMVSs (UTC and local time inconsistency)

#A24 & #A7: ATTEMPT TO DECOMMISSION AN ALREADY DECOMMISSIONED PACK

PREVENTIVE ACTIONS

➤ UNDERTAKEN BY NMVOs:

❖ Towards OBPs

- Verifying with the MAH if not other root cause of the alert
- Collaboration with Parallel traders and IT suppliers

❖ Towards End-Users

- Reaching out to End-Users to advise them on the incorrect process
- Educating End-Users regarding scanning best practices
- Testing software systems
- Collaboration with end-users and IT suppliers

➤ UNDERTAKEN BY EMVO:

- Relaying educational material and guidance to End-Users
- Assessing the means to improve system interoperability (timestamp issue in IMT, for example)

#A3 - UNKNOWN SERIAL NUMBER

ROOT CAUSES

- **CAUSED BY OBPs:**
 - Incomplete upload:
 - Serial number not uploaded
 - Correct serial numbers not uploaded
 - One element of the Data Matrix Code appears in the Serial Number field, because group separators have not been set properly
 - PSUM* request reaching NMVS before Pack state change, generating alerts
 - Misuse of (bulk) verification of packs by OBPs
- **CAUSED BY THE END-USERS:**
 - End-User software sends the wrong Serial Number, with a mismatch to the data encoded in the Data Matrix Code (e.g. incorrect reading of character cases, due to Y/Z transformation- UK/US vs DE keyboard)
 - The decoding software of the End-User was unable to correctly interpret the group separator characters and/or the scanner was incorrectly configured such that it failed to send the group separator characters
 - Manual entry error by the End-User
 - Failed scanning procedure : batch number incomplete (missing characters) or linear barcode (EAN code) attached to batch number

#A3 – UNKNOWN SERIAL NUMBER

PREVENTIVE ACTIONS

➤ **UNDERTAKEN BY NMVOs:**

❖ **Towards OBPs**

- Reaching out to OBPs to advise them on the missing data
- Collaboration with MAH and IT suppliers

❖ **Towards End-Users**

- Reaching out to end-users and End-Users' systems IT suppliers to urge the solving of scanners configuration
- Implementation of ad hoc solutions for End-Users' scanners testing and validation (caps lock, GS1 Data terminator reading, inverse barcodes, special characters, etc.)
- Educating End-Users regarding scanning best practices

➤ **UNDERTAKEN BY EMVO:**

- Relaying the information about scanners testing and validation solutions implemented by ZAPAZ and private suppliers

#A52 - EXPIRY DATE MISMATCH

ROOT CAUSES

- **CAUSED BY OBPs:**
 - Wrong expiry date uploaded, meaning that the data uploaded into the Hub is different from the data encoded in the Data Matrix Code (e.g. the date '00' printed in the DMC and then '31' uploaded in the in the EMVS)
 - One element of the Data Matrix Code appears in the Product Code field, because group separators have not been set properly

- **CAUSED BY END-USERS:**
 - End-User software sends wrong expiry date. For instance, some software and scanners being used by End-Users convert the expiry date 210600 wrongly into other dates e.g. 210531 or 210631 etc. instead of sending the data as encoded in the Data Matrix Code (210600) without adulteration or change)
 - Incorrect manual entry of the expiry date or misinterpretation of MM/YYYY

- **CAUSED BY THE SYSTEM :**
 - Inconsistent expiry date interpretation (interchangeability of YYMM00 and YYMM31) amongst national systems

#A52 - EXPIRY DATE MISMATCH

PREVENTIVE ACTIONS

➤ UNDERTAKEN BY NMVOs:

❖ Towards OBPs

- Reaching out to OBPs to advise them on the incorrect data
- Collaboration with MAH and IT suppliers

❖ Towards End-Users

- Reaching out to End-Users' IT suppliers to provide guidance
- Educating End-Users regarding scanning best practices
- Analyse alert patterns for software or scanning issues and communicate the issue to the respective IT provider

➤ UNDERTAKEN BY EMVO:

- “Expiry Date Mismatch” Letter of Announcement issued on the 8th April to OBPs
- Advising OBPs on how to proceed with the correction of data (EMVO Gateway access)
- Relaying educational material and guidance to End-Users

#A68 - BATCH ID MISMATCH

ROOT CAUSES

- **CAUSED BY OBPs:**
 - (Correct) batch not uploaded
 - Incorrect batch ID uploaded
 - One element of the Data Matrix Code appears in the batch field, because group separators have not been set properly
 - Misuse of verification action by OBPs to verify correct upload of MMP

- **CAUSED BY END USERS:**
 - End-User (software/scanner) sends the wrong Batch ID, with a mismatch to the data encoded in the Data Matrix Code
 - Incorrect reading of the characters in the batch, for example “/”, “_”, “-”
 - Manual entry error by the End-User
 - The decoding software of the End-User was unable to correctly interpret the group separator characters and/or the scanner was incorrectly configured so that it failed to send the group separator characters
 - End-User software sends the wrong Serial Number, with a mismatch to the data encoded in the Data Matrix Code (e.g. incorrect reading of character cases, due to Y/Z transformation- UK/US vs DE keyboard)
 - Failed scanning procedure : batch number incomplete (missing characters) or linear barcode (EAN code) attached to batch number

#A68 - BATCH ID MISMATCH

PREVENTIVE ACTIONS

➤ **UNDERTAKEN BY NMVOs:**

❖ **Towards OBPs**

- Reaching out to OBPs to advise them on the missing data and/or confirm the date of the release of the batch
- Collaboration with IT suppliers

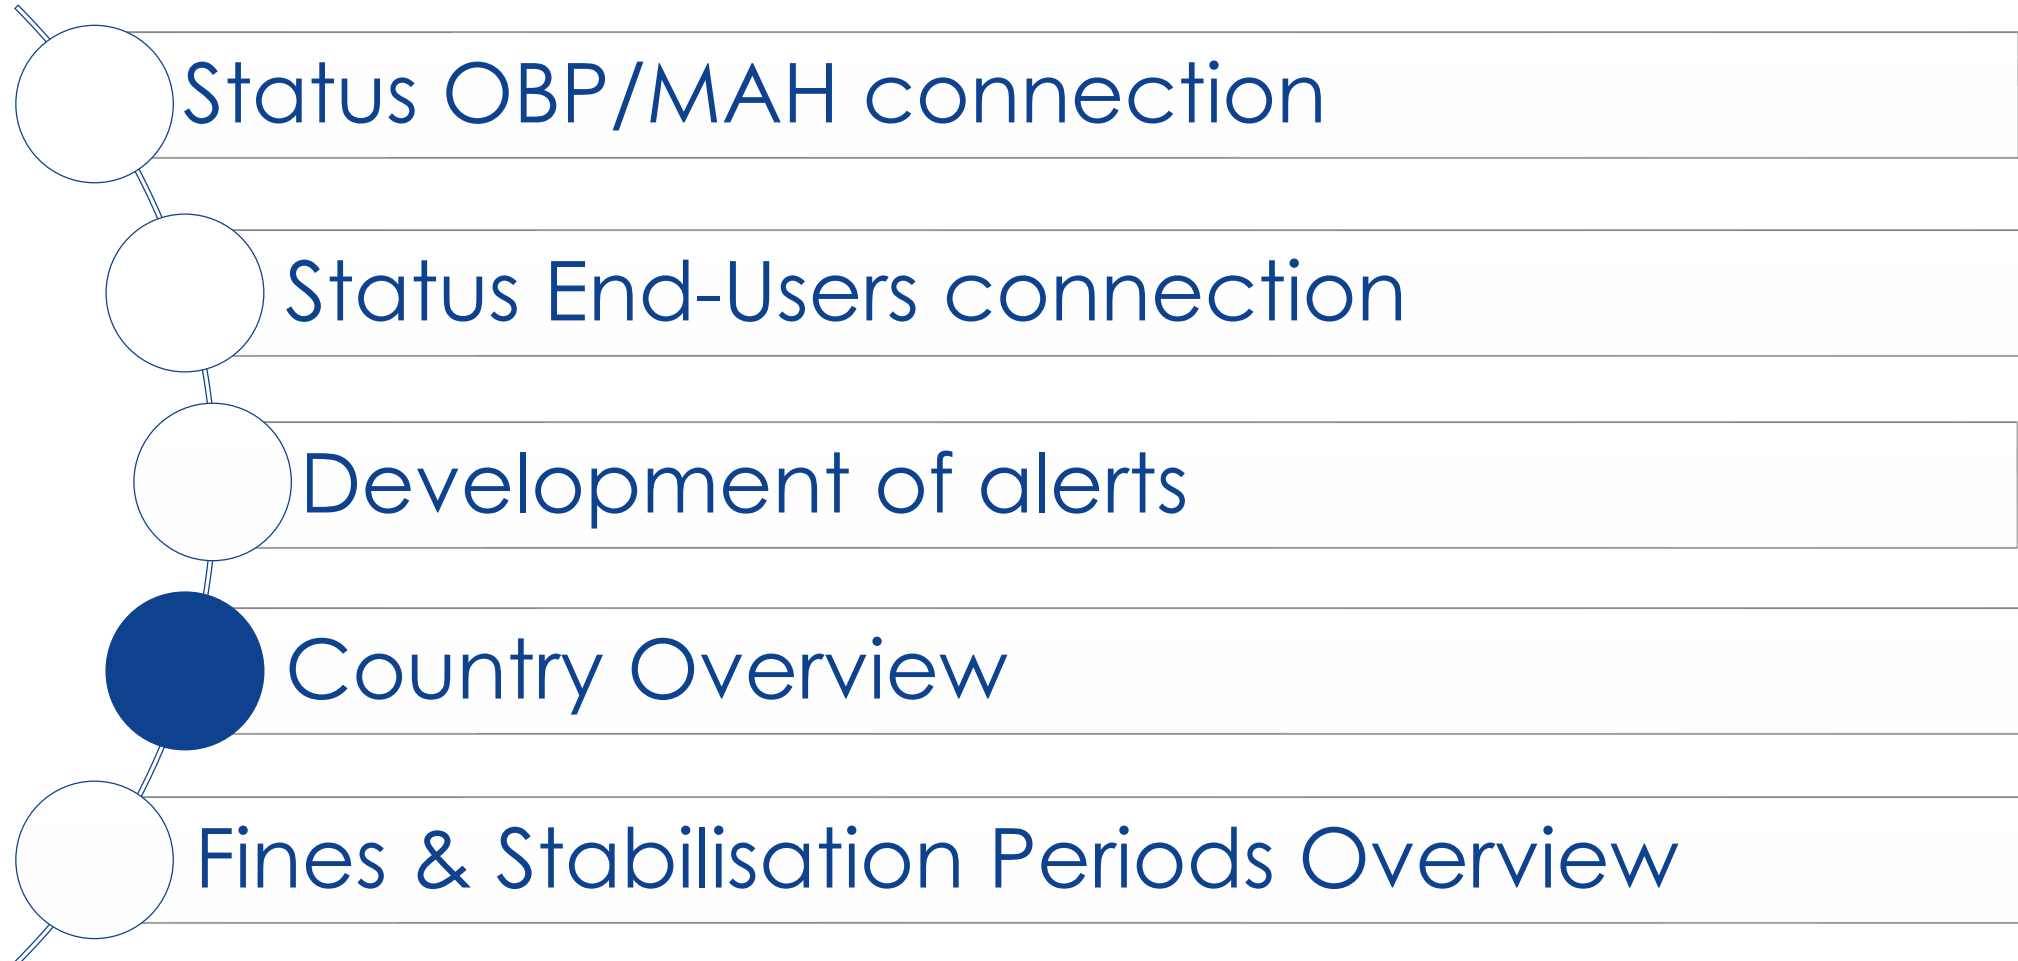

❖ **Towards End-Users**

- Reaching out to End-Users and End-Users' systems IT suppliers to urge the solving of scanners configuration
- Implementation of ad hoc solutions for End-Users' scanners testing and validation (caps lock, GS1 Data terminator reading, inverse barcodes, special characters, etc.)
- Educating end-users regarding scanning best practices

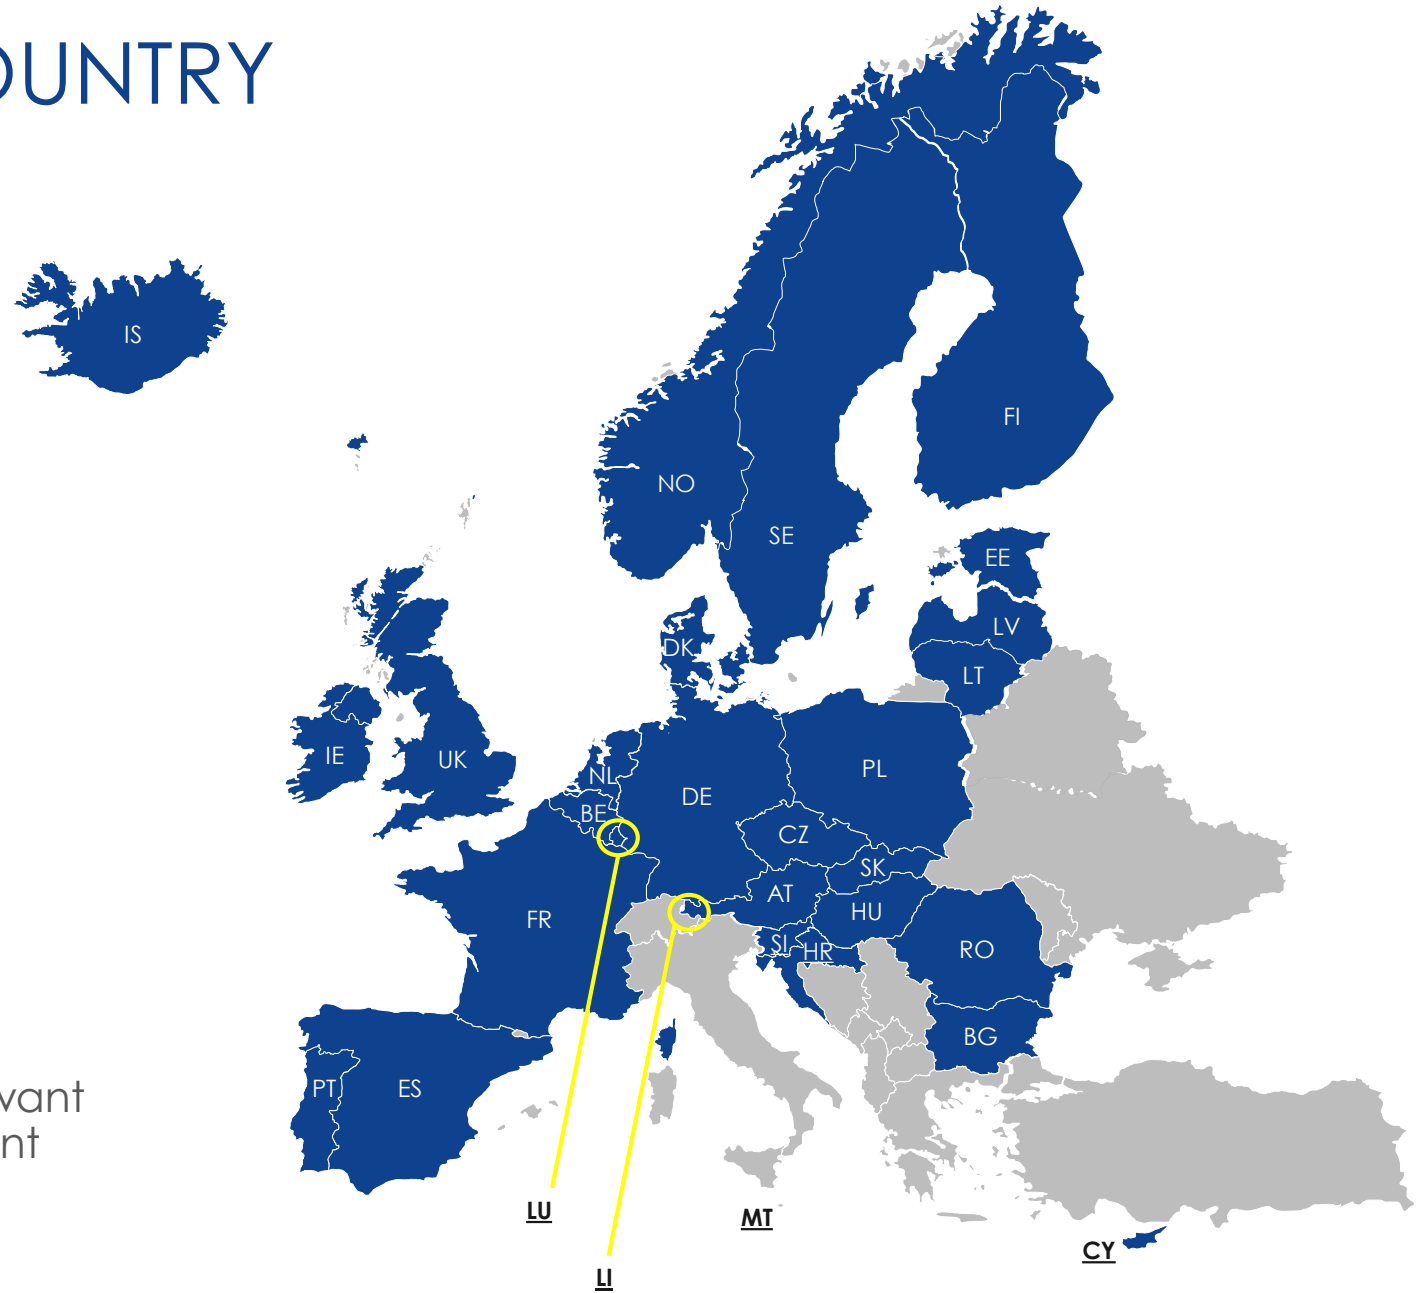

➤ **UNDERTAKEN BY EMVO:**

- EMVO has circulated guidance to the intention of the End-Users, through the IT suppliers and NMVOs, related to scanners configuration and European pack coding guidelines
- Relayed the information about scanners testing and validation solutions implemented by ZAPAZ and private suppliers

ABSOLUTE: ALERTS PER CATEGORY PER WEEK

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- Fines for non-compliance with the obligations under the Delegated Regulation will be implemented in Bulgaria after the approval of the changes in the Medicines Act by the Parliament. The expectations are the changes to be adopted by the end of H1/2020 but related to the COVID- 19 Emergency State the probability changes in the legislation to be postponed is high.
- During Week 9 and Week 10 the rates of alerts in Bulgaria was 0,9%-1,0%. Around 25-30% of the alerts are due to expiry date issues (A52 alerts) with several batches from one MAH. The issue has been communicated to the MAH but the batches are already released and distributed in the market so the alerts cannot be prevented.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

The number of A24 & A7 alerts was significantly higher in week 11. The distribution is as follows:

○ A7 alerts

- **177** A7 alerts were generated from 4 different Parallel Importers and 5 different batches. The analysis shows that the root cause is the same: the multiple attempts by the same user to decommission packs with „Checked-out“.
- **461** A7 alerts were due to bulk verification – main root cause is because two local IT providers have issues with the bulk operations and delayed response. These alerts are generated by 3 end-users
- **224** A7 alerts were due to End-users' software loops
- **49** A7 alerts were generated by End-users from other EU markets
- **397** A7 were generated in single transaction by local end-users and we are checking them case by case for double dispense (procedure errors by the same end-user) or second decommissioning attempt by a different end-user. We have increased numbers in local A7 due to the increased activity of pharmacies during the last week.

○ A24 alerts

- **112** A24 alerts were generated in bulk verifications, including 107 A24 alerts generated by one wholesaler during second attempt to decommission packs as Free-sample.

In the next couple of days BgMVO will contact the relevant users and IT providers to further specify the root cause and to agree with them on corrective and preventive actions. For more information, please do not hesitate to contact BgMVO.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

There was an increase of A7 Alerts during week 8 caused by 'MAH PPSU Request' transactions. The OBP/MAH tried to change the state of the bulk of packs into an already existing state. Two different MAHs caused 5.140 alerts. As of February, MAH/OBP initiated alerts amount to exactly 50% of the total Alerts in the system (5.140 by MAH; 5.140 Alerts caused by end-users).

■ 2020 Week 11	3344	3962	1406	1726	760

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

During week 11 the increase in A7 (Pack already in requested state) was caused by a single MAH/OBP operations who created 73% of these alerts during 1 day. The root cause might be the re-upload of data during a time out, as the successful upload was not notified to the OBP, the company tried it again and caused alerts.

The major increase in the number of alerts might also be due to the disruptions the EU Hub experienced from March 10 till March 12, as there was a problem uploading the data.

■ 2020 Week 11	2130	2198	1901	1407	2021

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- DMVO experienced an A2 alert leap from week 8 to week 9 primarily due to a handful of OBPs that have not uploaded data to the HUB, others have encountered errors with the serialization numbers for (a) particular batch(es), hence a few OBPs have had/or are seeking dispensation from the Danish NCA.
- In addition, a number of A2 alerts were triggered due to products released prior to FMD being on the market.
- DMVO is continuously monitoring the incoming alerts, they are reaching out to OBPs when detecting incorrect – or lack of – data in order to correct the data and provide their for any question

CAP 5.000

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- There was an increase in Alerts A7 & A24 during weeks 8 and 9. This category increased in February about 60% in comparison with January. In February about 10% of these alerts are caused by end users and 90% by MAH's. 89% - 1606 out of 1787 - are caused by 4 different MAH's. One of them caused 1000 and another 555 alerts related to the error "Bulk check out packs for EU distribution".
- The number of A24 & A7 alerts increased ten-fold from week 10 to week 11. About 10% of these alerts were caused by end users and 90% by MAH's. Most of the alerts, 3405 out of 4454, are related to the error "Bulk check out packs for EU distribution".
- End-users causing alerts are mostly related to human mistakes and these cases are investigated by the Estonian NCA

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- There was an increase in A24 alerts from week 8 to 9. A wholesaler was identified who had never been involved in mass alerts before. This wholesaler triggered 19.734 alerts " A decommissioning was attempted for a pack that is already inactive ". Only one MAH is involved with 4 products. France MVO has asked the wholesaler for explanations.
- The increase in the alerts during weeks 9-10-11 is the consequence of an issue with one wholesaler which is identified. There are 2 problems: one with the software and the other with the process between him and the MAHs. France MVO have sent e-mails and are still waiting for their action plan

CAP 70.000

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- The increase of A24 alerts in week 8 was caused by a handling error of one MAH. Due to a second attempt to set packs as free samples, more than 27.000 alerts were generated. The MAH was informed.
- During week 9, one MAH generated 79.744 A24 alerts by putting those packs as “locked” instead of “recalled” on the market. This triggered alerts for all packs that had been dispensed by End-users. The MAH and EMVO were informed.
- During week 11, the NMVS observed approx. 3.500 alerts (A24) generated by Parallel Distributor(s) trying to bulk check out packs for EU distribution several times. Since the initiator of the alerts cannot be found without EMVO assistance cases were provided to EMVO helpdesk. Investigation is still running.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

There was a significant increase in A7/A24 alerts in week 11 (84.098 in total).

- Three incidents caused 81.653 A7 alerts of these alerts - approx. 80.000 arose from one MAH trying to 'lock' packs and the remainder from check-out operations by 2 parallel distributors. Each of the actors decommissioned the packs on 10th March while there were EU Hub issues and then tried to do so again on 11th March, causing the alerts. It appears that in all cases, the original decommissioning request was successful but the MAH/parallel distributor did not get the necessary confirmation and retrying the operation caused the alerts.
- Approx. 600 A7/A24 alerts were due to locations within the health services designated as Article 23 decommissioning packs again on receipt. The health services FMD project team is working with the relevant sites and wholesalers to ensure that this dual decommissioning does not continue and the numbers of these alerts have fallen by 50% over the last 4 weeks.

■ 2020 Week 11	35	3607	189	6	151

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- During week 9 there was an increase in A24 Alert caused by one OBP (Parallel Distributor) with 2 products (number of packs 1000 & 555) who did repacking of these products. The OBP confirmed it was due to technical/procedural issues.
- The number of A24 & A7 alerts rose during week 11. All the cases identified (most part of all the OBP alerts) were related to the repeated check out and lock activities done by parallel distributors. For some of the cases, the OBPs confirmed that repeated activities were done because of the issues with the EU hub (missing response).

■ 2020 Week 11	118	24154	229	44	138

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- During week 9, there was an increase in A7 which was caused by mainly 3 products, as parallel traders were trying to set “Checked out” status for already checked out products. These products caused a total of 1.657 alerts. The rest of A7 were due to regular mistakes by the end users.
- During week 11 the number of A24 & A7 alerts rose significantly as different parallel traders attempted several times to change the status during a timeout on the HUB level when MAH could not get the response from the HUB.
- Due to COVID-19, the stabilization period has been reinstated, until the end of the quarantine set in Lithuania+30 days. Currently this would be till 21st of April.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

- During week 9, there was an increase of A3 Alerts due to one OBP who bulk verified circa 5000 items via the EU HUB (packs were not uploaded). Moreover there is one major IT supplier whose clients overuse CapsLock (Pharmacies below/SNs with letters), but this supplier just migrated over 6000 of his users to a new version of the software that corrects the user mistake. The differences from week 9 to 8 (on the total number of alerts) have been detailed in the table below.

Week 8		Week 9		Difference CW9-CW8	Reason
User group	% of alerts	User group	% of alerts		
Pharmacies	65%	Pharmacies	62%	+4 935	Analysis in progress (large number of multiple reasons)
Wholesalers	15%	Wholesalers	18%	+3 724	One wholesaler accidentally bulk dispensed twice two Batches of two products (over 10K items)
OBPs	7%	OBPs	10%	+3 444	One OBP with two MAHs bulk verified not uploaded SNs (ca 5000 items)
Hospitals	13%	Hospitals	10%	-883	Decrease
				+11 220	

- During this period, the system has known an increase of almost 1,7 mio in activity (6% growth of scans) and a 650K growth of successfully dispensed packs (7% growth).

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

The total number of alerts in Portugal was significantly higher in week 9, due to a software deployment at end-user side that has caused loops, generating multiple alerts for the same serial number at fixed time intervals.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

In Slovakia, one MAH caused an increase in alerts A24&A7 during week 9 by repeatedly using the G135 process - Bulk destroy packs - for the same set of packs (7975 pcs x 4 attempts= 31900 alerts). The MAH has been contacted to provide an explanation.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

In Slovenia, week 9 showed a slight increase in the total number of alerts, due to a medicine from a manufacturer which was not uploaded in EMVS; causing 106 alerts. There was also a significant peak last month on 7th February because of a MAH activity. However, there was no impact on distribution of medicines in Slovenia.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

In Slovenia, the response times for Alert investigation inquiries that ZAPAZ initiates with the stakeholders are tracked. A list of unresponsive cases is sent to the Slovenian NCA each week, ZAPAZ encourages their stakeholders to be actively involved in the alert investigation communication.

HIGHLIGHTS & ALERT EXPLANATION FOR THE PAST 4 WEEKS

During week 9 there was an increase of 500.000 alerts due to a problem in the communication network of several pharmacies of the same region. Some of these pharmacies could not manage correctly their contingency situation, generating these false alerts.
